I can honestly say I did not expect to choose the "Export Process" tab in the first place, since the Lightroom import process seems to me one of the more frustrating aspects of this piece of software. It is intended for converting RAW images with almost no manual intervention, but we still must do some work to get them there. There is only a single action here, and it includes three options: unpack the image, resize it and export it. The "unpack" option actually lists the three separate RAW files as one, so you can actually see what is occurring behind the scenes. The second and third options do not share a single feature, although they have some similarities as well. Each provides the same features as the previous one, but in a more "tweakable" way. For example, select an option here, and the previews will change as you adjust the settings. In the Optimize Image panel, you can see your adjustments after each change. If you are not happy with the results, go back and tweak them again. This is probably the most compelling feature of the Export window. Other than that, there isn't much more to see here. Should you get excited about all these new features offered in this version of Photoshop? Yes, but only to a certain degree. Personally, I would have liked to see some of these "fancy" tools integrated into Lightroom, so that I could use them directly and avoid the tedious copy-paste approach being used now. For example, I have long been waiting for the Prints panel to be merged with the Lightroom settings. It would really help me save some typing to just tap once when I wish to change a color profile, paper type or security level.
